Clone distribution: NCI-CGAP Clone distribution information can be
found through the I. M.A.G.E. Consortum/Liml.at:
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared but off off the at constant velocity. The sheared but off off the at constant velocity. The sheared but of but off the at constant velocity. The sheared but off the adaptor oils off and at a cases. The adaptored but ends in high molar excess. The adaptored but was purified and size-selected for a 9.5 to 10.5 kb range using preparative agazose gel electrophoresis. Vector DNA was prepared from a derivative of pWG42 (alif132114/19b) h8713072.]), a copy number inducible derivative of pasmid 81. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored overtor may annealed to adaptored overtor may annealed to adaptored overtor plan, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for amplicillin resistance.

Direct Submission

Submitted (10-DEC-2000) Trypanosoma brucel genome sequencing
project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton,
Cambridge CB10 iSA, E-mail: barrell@sanger.ac.uk and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanesoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + 1 method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing A Practical Approach, eds. H. Vaudin and B.
Barrell, Oxford University Press, 1999).

Chipsivalury modes are non-second contents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0 005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymoreleotides kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb rapege using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pheavily of preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of plasmid R1. The vector was liqated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored ector DNA, and transformed into chemically competent E. coli XLIO Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A552612.

/actor—line mouse that pressing occurs thereby /actor—line mouse that pressing occurs thereby /actor—line mouse that thereby year. It is a profession of the line as a constant of the line as a constant of the line as a constant of the line as a part of the line as a constant velocity. The sheared but was hydrodynarically sheared by repeated passage through a was hydrodynarically sheared by repeated passage through a was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high moular excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwhot? (gila/32114)gblAsi29072.11, a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chancally-competent E. coll XL10-Gold (Stratagene) cells and sicected for a 3 c

                                                                                                                                                   FEATURES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TITLE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 hoch orifice at constant velocity, the sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymecacide kinase. Adaptor oligonucicotides were ligated to the blunt ends in high molar access. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis vector DNA was prepared from a derivative of public (gill/3114) gph/R12907.1.), a copy number of public derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to damptored vector DNA, and transformed into chemically competent E. coll XIIO-Gold (Stratagene) cells and selected for ampicillin resistance.

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 14 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel. electrophoresis. Vector DNA was prepared from a derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            University of Utah

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TITLE
```

```
(http://www.dax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymocleotide kinase. Adaptor oliganucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gl14732114/gb1AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XLIO-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5

of pwD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The Sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli xLID-Gold (Stratagene) cells and selected for amptcillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        http://www.lax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constent velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored bNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gcl electrophoresis. Vector DNA was prepared from a derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Unpublished (2000)

           of pWD42 (gil47321141gb]AF129072.1), a copy-number inducible derivative of plasmain R: The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLI0-Gold (Stratagene) cells and selected for amplitally resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AZ440999 35 bp DNA linear GSS 03-OCT-20C0 IM0233G22F Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0233G22 F, DNA sequence.

of pWD42 (g1|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                   48 bp mRNA linear EST 03-DEC-1999 FI-367D 22 week old human fetal liver cDNA library Homo sapiens cDNA clone F1-367D 5', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhin; Hominidae; Homo.

//note="vector: PWD42nv; Purified genomic DNA from M
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.065 into crifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            electrophoresis vector DNA was prepared from a derivative of pMDA2 (gil473114)gibAF12907.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified the sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coli XL10 Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                            GSS 04-OCT-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

Double-stranded cDMA was liqued to Eco R1 adaptors: Pharmacia, digested with Not I and cloned into the Not I and Eco R1 sites of the modified pT713 vector. Library is normalized, Library was constructed by Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CONA Library Preparation: N. //cole="PCR was performed on DNA from Arabidopsis thaliana
plants (T1) which were transformed with the T-DNA from
vector pACLio. The lines contain one or more T-DNA
insertions. The DNA fragment(s) resulting from the PCR
were directly sequenced to determine the genomic sequence
flanking the insertion. Sequences alsplaying significant
similarity to the A. thalaina nuclear genome sequence
processed for submission. T-DNA derived sequences were
                                                                                                                                                                                        Strizbow, N. Rosso, M., Li, Y. and Weisshaar, B.

Strizbow, N., Rosso, M., Li, Y. and Weisshaar, B.

Direct Submission

L. Submitted (17-JUN-2002) Weisshaar B., Max-Planck-Institut fuer

Indicates an insertion within the locus defined by clone Fl4K14.

The sequences are generated at the MPI for Plant Breeding Research

In the context of the GABI-Kat project. GABI-Kat is part of the

German Plant Genomics program designated 'GABI'. Information on

line availability can be found at:

/musculus G578L/50 (male) was obtained from the Jackson
laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide Kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwid (gil4/32114) [ap/RR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coll XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                               5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AL758605 45 bp DNA linear GSS 18-JUN-2002 Arabidopsis thaliana T-DNA flanking sequence GK-160D11-013216,

/note="Organ: Lung: Vector: pT773D-Pac (Pharmacia) with a noteroendocrine lung: Vector: p773D-Pac (Pharmacia) with a modified polylinker: lst strand cDNA was prepared from neuroendocrine lung: vectorioid, and was then primed with a NOL I - 0.100 off) primer. Double-stranded cDNA was ligated cloned into the Not I and Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified p7773 vector. Library is normalized Library was constructed by Bento Soares and M. Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Department of Virology

//clone="PCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC106. The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. Sequences flanking the insertion. Sequences flanking significant similarity to the A. thalaina nuclear genome sequence were processed for submission. T-DNA derived sequences were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission

Zuechtungsforschung, Carl-voor-Linne-Weg 10, Koeln, 50829, Germany
This sequence is recovered from the left border of the T-DNA. It
indicates an insertion close to or within gene At19,2970. The
sequences are generated at the MPI for Plant Breeding Research in
the context of the GABI-Kat project. GABI-Kat is part of the German
Plant Genomics program designated 'GABI' Information on line

(http://www.jax.com/necources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were 11gared to the blunt end sin high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pwm042 (gil47321141gblAF129072.1), a copy-number ligated inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

// Jab. host-er construction and an arrange of property of passing occurs initiary / Jab. host-er coil strain X10-Gold, T1-resistant, F.*
// Jab. host-er coil strain X10-Gold, T1-resistant, F.*
// Anote-"Vector: Pub0420v; Putified genomic DNA from M. musculus C57Bx/6J (male) was obtained from the Jackson Laboratory Whose DNA Resources/documents/dnares/). The DNA was bydrodynamically sheared by repeated passage through a 0.05 luch orifice at constant velocity. The sheared DNA was Dunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was putified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis: Vector DNA was prepared from a derivative of pWD42 (qil473114 (ppl.RF129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was sunnealed to

musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size selected for a 9.5 to
0.5 kb range using preparative agarces gel
electrophoresis. Vector DNA was prepared from a derivative
of pWDA2 (9i14732114|9b|AF129072.1), a copy.number ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A2309443

/Jam.host. E. Coll strain XIIO-Gold, Ti-resistant, F. (700cm.* Vector: Publizary Purified genomic DNA from M. musculus C57BL/6J (male) was Outsided from the Jackson. Laboratory House DNA Resource documents/dnares/). The DNA wish yield-yield from the Jackson. Laboratory House DNA Resource documents/dnares/). The DNA was hydrofynamically sheared by repeated passage through a 0.005 inch ortifice at uconstant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymorlectide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored bunk was purified and size-selected for a 9.5 to 10.5 k in in the build proparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwbol gillsylladighth/19072. J., a copy number of pwbol gillsylladighth/19072. J., a copy number of pwbol gel derivative of plasmid R1. The vector was ligated with adaptors complementary to the Insert adaptors and purified. The shaered, adaptored mouse DNA was anneated to adaptored vector DNA, and transformed into chemically competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance.

musculus C57BL/6J (female) vas obtained from the Jackson Labocatory Wouse DNA Resources / documents/dnares). The DNA vas hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA vas blunt end repaired with TA DNA polymerase and TA polymicleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The sheared DNA cas blunt ends in high molar excess. The sheared DNA cas blunt ends in high molar excess. The oligonucleotides were ligated to the blunt ends in high molar excess. The sheared DNA cas purified and size-selected for a 9.5 to along the stange using properative agarcase gall electrophoresis, Vector DNA was prepared from a derivative of prode (gil4732114) place). In a copy-number inducible derivative of plasmid RI. The vector was Ilgated with adaptored wector Mas and transformed linc of hemically completent E. coli XLI0-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DEFINITION MAXABLEO. The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwM42 (gil4732114(pplAF129072.1), a copy-number inductable derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AZ442808 44-OCT-2000 1MO237NOBF Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0237NOB F, DNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a bolos inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymotleotide kinase. Adaptor oligonocleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil47314)(gbl47129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa: Chordata; Cranlata; Vertebrata; Euteleostomi; Mammalla; Eutheria; Rodentia: Sciurognathi; Muridae; Murinae; Mus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          double-stranded CDMA was size selected, lighted to ECO RI adapters (Pharmacia), digested with Not 1 and cloned into the Not 1 and ECO RI sites of a modified pr773 vector (Pharmacia). Library went through one round of normalization to a Cot - 5. Library constructed by Bento Soares and M. Ratima Bonaldo. This library was constructed from the same fetus as the fetal heart library, Soares fetul heart NbH1gy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AU104948 Sugano Homo sapiens cDNA library Homo saplens cDNA clone HEP19427, mRNA sequence.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified p7773 vector. Library is normalized. Library was forner constructed by Bento Soares and M. Fatima Bonaldo.
    purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLi0-Gold (Stratagene) cells and selected for amplitilin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDNA Library Freparation: M. Bento Soares, Ph.D.

//sector: Pupd2ny: Purified genomic DNA from N.
musculus C758L/63 (male) was obtained from the Jackson*
Laboratory Wouse DNA Resources/documents/danses/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerses and T4
polymer/conide kinase. Adaptor oligomerlectides were
1/gated to the blunt ends in high molar excess. The sheared DNA
was blunt ends repaired with T4 DNA polymerse and T4
polymer/conide kinase. Adaptor oligomerlectides were
1/stated to the blunt ends in high molar excess. The sheared DNA
as blunt ends repaired with T4 DNA polymerse and T4
polymer/conide kinase. Adaptor oligomerlectides were
1/stated to the blunt ends in high molar excess. The sector of partitied and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of phot/2 (di/4732114/gb/AF129072.1), a copy number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chantcally-completent E. coll XL10-Cold (Stratagene) cells
and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota: Metazoa: Chordata: Craniata: Vertebrata: Euteleostomi; Hammalia: Eutheria: Primates: Catarrhini: Hominidee: Homo.

was blunt end repaired by repeated passage through a was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch or little at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymerase and 74 polymerlectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcase gel electrophoresis. Vector DNA was prepared from a derivative of prus4 (gil473214 gpl AR129022.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coll X10°Gold (Stratagene) cells and selected for applicable research and transformed into chemically competent E. coll X10°Gold (Stratagene) cells and selected for applicable research and selected for a process and a selected for a process a

was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor of oligonucleotides were
ligited to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb ange using preparative agarose gel
electrophoreals. Vector DNA was prepared from a derivative
of pMD.2 (9147321419blAR129072.1), a copy number
indicible derivative of plasand RI. The westor was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared adaptored mouse DNA was annealed to
chemically competent E. coll XIIO Gold (Stratagene) cells
and selected for amplitin resistance.

was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was prepared for a 9.5 to 10.5 kb range using preparative agarose gel ectrophoresis. Vector DNA was prepared from a derivative of pwv4.2 (gild/32114 [gb]AR129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coll XL10-Gold (Stratagene) cells and selected for ampicilin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1-3) Yamada-oka, Suita, Osaka Pref. 565, Japan

Human Gene Signature. 3' -directed cDNA sequence. We are not
submitting the same cDNA sequence redundantly to DBLS since 1993.
For the abundance information of clones with this sequence in this
library and as well as in other 3'-directed libraries, see'
http://www.lmbb.osaka.u.ac.jp/bodymap'. The sequences of the clones
represented by this Gs sequences is also found there.

Monocytes were prepared from blood by ficoll-hypaque,
percoll and T cell rosetting purification steps (purity:
96 t). mRNA was prepared from activated monocytes from a
patient with rheumatoid arthritis. mRNA was reverse
transcribed with MuLV. Using Eco-RI linkers CDNA was
cloned into 1-gt-11 vector arms. The CDNA library was
specemed by differential hybidization using radioactively
marked ss-CDNA from activated and non-activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C21077 49 bp mRNA linear EST 23-OCT-1996 HUMGS0002591 Human adult (X.Okubo) Homo sapiens cDNA 3', mRNA

Anote-"vector: PWD42nv: Purified genomic DNA from H. masculus C59EL/G1 (male) was obtained from the Jackson Laboratory Nouse DNA Hesources.

Laboratory Nouse DNA Hesources.

(http://www.jax.org/resources./documents/dantes/). The DNA was hydrodynam.cally sheared by repeated passage through a 0.005 lunch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymorleoLide kinase. Adaptor oligonocleoLides were injected to the blunt ends in high molar excess. The adaptored to the blunt ends in high molar excess The adaptored to was purified and size-selected for a 9.5 to 10.5 k range using preparative agarose gel ectrophoresis. Vector DNA was prepared from a derivative of pWD42 (9:14732114(b)Ar129072.1), a copy.number inductable derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampiciallin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AA868967 34 bp mRNA linear EST 04-JAN-1999 ak55q04.s1 Soares_Lest1s_NHT Homo sapiens CDNA clone IMAGE:140910 ab 1 similar to SW:TS24_MOUSE P53995 PROTEIN TSG24 ;, mRNA sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
Library constructed by Bob Barstead. The C2C12 cell line (available from ATCC, catalog # CRL-1772) differentiates rapidly, forming contractile myotubes and producing characteristic muscle proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AA996016

34 bp mRNA linear EST 27-JUL-1998 os26610.s1 NCI_CGAP_Kid5 Homo sapiens cDNA clone IMAGE:1606483 3' similar to TR:Q69340 Q69340 ORF1, ORF2, AND ORF3. ;contains MSR1.b1 MSR1 repetitive element ; mRNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          // Jab. host. E. Coll strain XLIO-Gold. Ti-resistant, F. Note-Vector: PMOAZO: PUTIGE defended. The final by Moazo: Putigled genomic DNA from M. Mosce-Vector: PMOAZO: Putigled genomic DNA from M. Mosce-Vector: PMOAZO: Putigled genomic DNA from M. Daboratory Wouse DNA Resource (Attp://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated possage through a 0.005 inch oritice at constent velocity. The sheared DNA was blunt end: repaired with Tt DNA polymorlectide kinase Adaptor oligonuclectides were adaptored the blunt ends in high molar oxcess. The saperced by was purified and size spiceted for a 9.5 to 10.5 kb range using preparative agazose gel electrophoresis. Vector DNA was prepared from a derivative of pwok (4014732141901721), a copy number inducible derivative of plasand 81. The wector was ligated with adaptors complementary to the insert adaptors and putflied. The sheared adaptored mouse DNA was annealed to adaptored vector DNA, and fransformed into chancelly competent E. coll XIIO-Gold (Stratagene) cells and selected for ampicillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Enkaryotts Metazoa; Chordota; Craniata; Vertebrata; Euteleostona; Choranalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. /orde='Organ: leaf' Vector: RescueMu (engineered from pBlueScript backbone); Site_I: BamHI: Site_2: BglII:
RescueMu is a 4.9 kb, modified malze Mu transposon dessigned to allow plasmid rescue from total genomic DNA. Wu elements insert preferentially into transcription units. For more information on RescueMu, go to the veb site www.amdb.isastate.edu and Gollow the links for 'RescueMu.' Grid I was grown at Berkeley in 2001. DNA was extracted from leaf punches. Abuble digested using BamHI and BglII; and ligated to form circular plasmids. DH10B colls wet transformed and then screened on LB plates with

                       (http://www.jax.org/resources/ocuments/dnares/). The DNA was hydrodynalically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerses and T4 polymuclectide kinase. Adaptor olisonotlectides were ligated to the blunt ends in high molar excess. The adaptored by a was purified and size-selected from a derivative of phDA was purified and size-selected from a derivative of phDA signification by a signification of the sample with adaptore of the sample with adaptore of phSMA was namealed to derivative of phSMA signified. The sheared, adaptored mouse DNA was manealed to adaptored occupantly competent E. coli Xil0-Gold (Stratagene) cells and selected for ampleillin resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens (human)
